

WHAT IS CLAIMED IS:

1. An intramedullary nail, comprising:
 - a hollow shank, having a plurality of crotched members disposed along the axial direction and extended from an end of said hollow shank; and
 - 5 a mobilizable bar, passing through said hollow shank and having an expansion head disposed at an end where said mobilizable bar passes through said crotched member, and said mobilizable bar being expanded from an end proximate to said crotched member to another end and said mobilizable bar having a fixing means exposed from another end of said hollow shank.
- 10 2. The intramedullary nail of claim 1, wherein said expansion head is increasingly expanded from an end proximate to said hollow shank to another end.
3. The intramedullary nail of claim 1, wherein said fixing means is a nut.
